

# From Complex to Cloud-Ready

Railscluster is a specialist in managed Ruby-on-Rails hosting, serving clients with high-performance cloud infrastructure and DevOps expertise.

*"Future readiness, value and ease of doing business with Edgenexus were key influencers in choosing the ALB-X."*

**Roderick Van Domburg, COO, Nedforce**

## The Challenge

Railscluster's previous load balancing solution lacked flexibility, with rigid licensing, slow support, and minimal visibility into traffic flow.

Their team needed a solution that could support complex routing for custom Rails environments, handle SSL termination, and offer HA clustering, while reducing time spent on configuration.

## The Solution

Railscluster deployed Edgenexus EdgeADC to take full control of their load balancing environment.

With support for high availability and seamless SSL offload, EdgeADC became the central traffic manager across multiple customer applications and environments.

## The Results

- Fast and reliable traffic routing for custom app stacks
- SSL offload and HA deployment simplified
- Dramatically reduced time to configure, test, and go live
- Freed up technical team to focus on high-value development, not infrastructure fixes

## Why Edgenexus

Why They Chose Us:

- Purpose-built for dynamic web hosting and app delivery
- No-code traffic control with flightPATH™
- Fast, responsive support from real engineers
- Cost-effective licensing that scales with demand

## Favourite Feature

"Our overall experience with Edgenexus has been very positive. On the occasions where we have required support, the technical team have demonstrated a high degree of customer intimacy and understanding and have always been willing to go the extra mile for our satisfaction."
